

are you **overwhelmed**
by security information?

Today's security
analysts report
that they are
inundated with the
sheer volume of
security information

... it's hard to get
time to do what is
necessary to protect
ourselves for today:
let alone plan for the
increased threat
of tomorrow.

Bombarded by security information? Reactionary - not planned?

Today's ICT security analysts report that they are struggling under the sheer volume of security information: logs of incidents, security alerts and reports of new security threats... it's hard to get time to do what is necessary to protect ourselves for today, let alone plan for the increased threats of tomorrow.

Some of the concerns include:

- I need to obtain a global view of enterprise security status
- My IT security solutions don't cover all our legacy applications
- I want to be able to see who or what is connected to my network in real time
- I lack the time and resources to analyse my IT security environment effectively
- I am concerned about the endless cycle of new and unknown threats

What if:

- there was a way to automatically aggregate, analyse, prioritise, and monitor events across the network, host and application layers of your IT infrastructure, whilst reporting on events and resolution times - all in real time ?

Introducing:

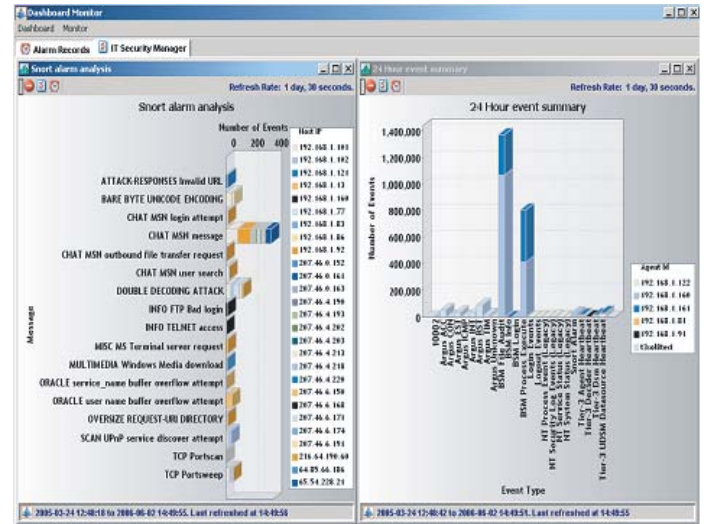

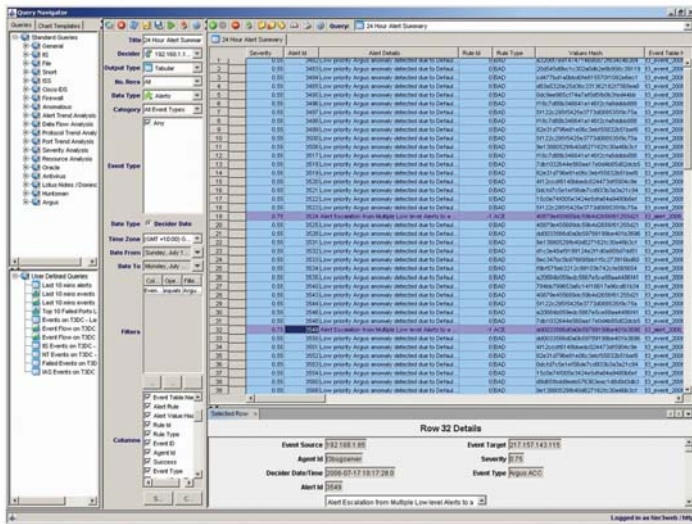

Huntsman: The only complete real-time threat management system

Turn Information into actions

Dynamic behavioural modelling establishes the baseline of events across the enterprise. Divergence from these learned profiles permits the automatic identification and management of unusual and suspect events. A sophisticated correlation engine instantly contextualises alerts enabling the remediation of threatening ICT events in your environment as they occur.

Centralised logging for audit and control

Huntsman establishes a forensically sound repository for all enterprise audit data and normalises all collected information into a common format enabling efficient storage and retrieval. With Huntsman you can analyse all information from a central point utilising standard or customized reports.

Improve Security Management capabilities

Huntsman LiveView interactive dashboards enable the creation of an operations centre style view featuring a completely customisable set of monitors that can be tailored to an individual user. At any time a dashboard can be "drilled into" enabling an analyst to harness the investigation capabilities of the LiveView query navigator if a suspicious event occurs. The dashboard can also be configured to monitor thresholds and other configurable parameters and provide an audible alert when an event occurs.

Integrate with your current security and encryption tools

All components of the Huntsman system support industry standard encryption and authentication technologies and can be configured to support the highest levels of security. This ensures that all data transported across the Huntsman framework remains secure.

Multi Layered Anomaly Detection

The Huntsman Behavioural anomaly detection engine actively protects your network infrastructure ensuring business operation and availability as well as protecting against data theft from business applications such as databases, financial systems, intranets and more. Traditional rule or signature based systems by definition are only capable of detecting threats they have been programmed to identify. Whilst effective against known threats they offer little or no protection against the increasing danger of unknown threats.

The answer lies in being able to collect and manage events from across the enterprise, and then prioritise for remediation those which present an unacceptable or unfamiliar level of risk to stakeholders.

Why Huntsman?

Intelligence-lead, policy-driven, Huntsman enables you to protect yourself from regulatory and financial damage that can result from an undetected security breach. Huntsman monitors for all forms of unusual and unacceptable activity, and provides comprehensive operational risk and compliance analysis

HUNTSMAN

Huntsman manages risks that threaten ICT asset confidentiality, integrity and availability. Huntsman protects shareholder confidence, brand value and the bottom line.
