

HUNTSMAN®

Intelligent Security

Enterprise-wide protection

Organisations with the most exacting security requirements, like those in defence, law enforcement and intelligence services, choose Huntsman® Intelligent Enterprise Security.

With its patented Behaviour Anomaly Detection technology, Huntsman® protects their security assets in real time, whilst ensuring legitimate access and use, and uninterrupted business operation. In their environments and yours, Huntsman®:

- Aggregates all IT system and user data;
- Consolidates information silos to a single view;
- Enables multi-dimensional real time analysis;
- Monitors the whole enterprise for behavioural change;
- Prioritises events to investigate based on risk.

The modern IT security environment is complex, with myriad components including mainframes, servers, desktops and mobile devices, not

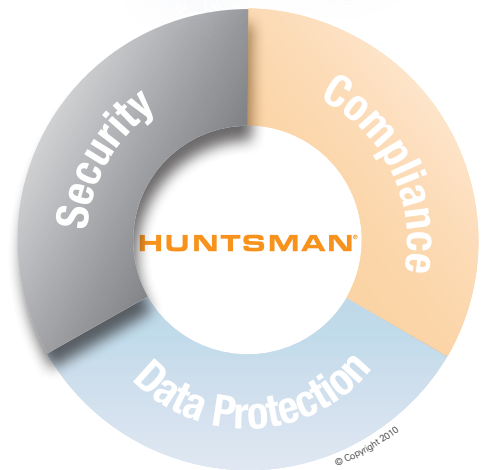

to mention business applications and security devices. Many of these components operate independently or with limited integration, creating silos of information that are barriers to usable security intelligence.

Holistic real time protection

Traditional point security solutions monitor, log and store data independently, but, when an incident occurs, it may take hours or days to find the root cause of a malicious threat.

Huntsman® aggregates all data from your existing devices and applications into a single information repository, regardless of data format. In this way, Huntsman® provides a single, centralised view of your network with total visibility, via a single LiveView console.

With Huntsman®, in the event of a server or firewall failure, the exact location can be pinpointed, the root cause identified and operations quickly returned to normal; your security team can find 'the needle in the haystack', decide if it constitutes a threat and, if so, take appropriate action in real-time.

Security
Aggregates systems
Consolidates data
Analyses in multi-dimensions
Monitors for change
Prioritises actions

Intelligent Security. We invented it.

HUNTSMAN®

Intelligent Security

Multi-dimensional analysis

Many security systems correlate time and events, but rarely do they correlate between systems. Therefore, seemingly innocuous or unrelated events in different information silos will generally remain undetected.

By consolidating all your system and user data into a single addressable and analysable format, Huntsman® enables rapid, detailed scrutiny of all information silos, across multiple attributes. Instead of just seeing the obvious spikes of malicious activity, Huntsman® also sees the seemingly unrelated activities, giving your staff the ability to connect the dots. In this way, Huntsman® sees the threats that others miss, like the executive who, unusually, has gained after hours access and is also copying sensitive information.

Monitors behavioral change

Traditional security systems will detect activities that break pre-defined rules or signatures that match malicious precedents, but they struggle to stop the insider who knows the rules and how to circumvent them.

Huntsman®'s patented Behavioural Anomaly Detection is the core of its intelligence. Once installed, Huntsman® collates all your IT

system and user data, and analyses it to form a baseline of normal behaviour. Using its patented intelligence, Huntsman® then continuously monitors your systems for unusual activity, checking the degree of change and relative significance. This way, Huntsman® only alerts to changes that are significant, such as a disgruntled employee who is, unusually, printing customer databases, but not another who routinely does this for his job.

Alerts events to investigate

Most security systems will alert to events that cross obvious thresholds, but they can't assess the risk associated with less obvious activity that may pose an even greater threat.

By monitoring for the unexpected, Huntsman® detects vast numbers of related and unrelated events. Using its inbuilt intelligence, Huntsman® is able to interpret these events in the context of risk, impact of risk and cost to the business; it then prioritises them for investigation, for immediate action or just for information. In this way, your security system builds up a knowledge base of unusual activities, and so can deal quickly with the risky few that pose a genuine threat.

Huntsman® provides a single centralised view of your network with total visibility

Local and global support

An Intelligent Security solution must be able to meet your organisation's specific and unique needs. With offices internationally, Tier-3 is well placed to assist both locally and globally. The speed and ease of its deployment, combined with its scalable, modular and cost effective design are more reasons why so many organisations with exacting security standards choose and continue to use Huntsman®.

Contact us about how Huntsman® will secure your organisation's IT assets, intelligently.
